

Installation Instructions for VCDS® version 17.8

The vast majority of users who are installing VCDS do not need to change anything on this screen and can simply click the “Next” button. However, to avoid countless phone calls and e-mails asking what these options do, we present this guide.

Install Current USB Drivers: is recommended for if you’re using any of our older interfaces and is selected by default.

Fix Window HID power management: is only available if the installer is run on Windows 8.1 or Window 10, where it is selected by default. It is required for the HEX-NET and HEX-V2 interface to communicate reliably via USB on systems running Windows 8.1 or newer.

Open Window Firewall for HEX-NET & VCIconfig: is useful if you will be using a HEX-NET interface via WiFi. If you select this option the installer will attempt to allow VCDS and VCIconfig to establish outgoing connections from your PC necessary for it to HEX-NET(s) on your network. Please enable this option if you plan to use a HEX-NET via WiFi.

Install 32-bit EXE on 64-bit Systems: can only be selected if your PC is running a 64-bit Windows. The vast majority of users with 64-bit Windows do not need this option and should use the 64-bit EXE files which are installed by default on those systems. However our 64-bit EXE may not work properly on a small percentage of 64-bit systems, and this option give those users an immediate work-around.

Create Start Menu Shortcuts: is selected by default and will put the usual entries in your Start Menu. However, if you don't want to clutter up your Start Menu, you can de-select this.

Create a Desktop Shortcut: is selected by default and will put the usual shortcut on your desktop. However, if you don't want to clutter up your Desktop, you can de-select this.
